

eRTD

INTERNET-BASED TRADING DESKTOP

eRealtime Trading Desktop (eRTD) is RTS' high-performance front-end trading platform for professional and retail customers. eRTD, which runs on the Java platform, is the Internet-based version of RTS' professional trading platform RTD. It provides many of the same first-class features found in RTD in a cost-effective, scalable and quickly-deployable package. eRTD is browser independent and can easily be re-branded.

PROFESSIONAL-STYLE TOOLS

Many features in eRTD are based on features found in RTS' RTD software for professional traders. Orders can be executed via a number of market displays, while eRTD's Spreader functionality allows traders to trade standard exchange supported spreads as well as customized, multi-leg and multi-exchange strategies. All spreader calculations are done on the server in order to further optimize performance.

FULL RISK CONTROL

RTS' risk management has been adapted to suit the special needs of brokerage and clearing firms. Risk management software resides on the server, allowing for centralized risk management. With RTD' sophisticated risk capabilities combined with control components for eRTD, managers are able to define pre- and post-execution limits for positions, trades, users and user groups. This level of granularity guarantees unprecedented comprehensive risk analysis and control on an account and user level.

PERFORMANCE

Like RTD, eRTD is based on an exchange-independent client server infrastructure, which is both scalable and flexible. The communication server forms the core of the system and acts as the interface to other RTS software solutions.

SUPERIOR MARKET ACCESS

RTS offers high-performance, Direct Market Access to over 100 exchanges and liquidity pools from one window. Most European and North American, as well as a number of Asian, and Middle Eastern Exchanges are already available. RTS also offers access to a network of leading brokers. Data centers and hosting facilities located around the world offer rapid deployment and hassle-free access to exchanges and other trading venues.

WHITE LABEL OPPORTUNITIES

RTS is recognized throughout the international trading community as a provider of robust solutions. Now RTS offers brokerage companies the capability to provide the same level of quality to their customers – with their own corporate identity. White labeling eRTD is a way to quickly deploy a robust, low maintenance trading system. As RTS has considerable experience in implementing white label solutions, time to market is greatly reduced as compared with rolling out an in-house solution.

eRTD

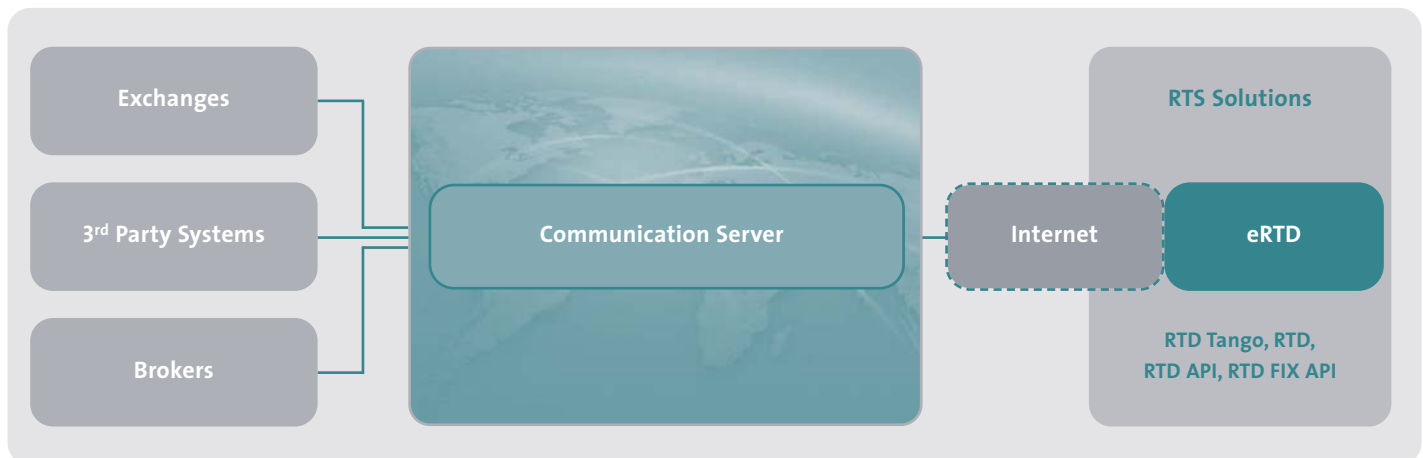

INTERNET-BASED TRADING DESKTOP
